

An aerial photograph of the Green Bank Observatory's 100-foot radio telescope. The dish is a large, white, segmented structure supported by a complex metal lattice. It is positioned in a valley surrounded by dense, forested hills. The sun is setting behind the hills in the background, creating a bright orange glow and long, radiating sunbeams. A winding road and some small buildings are visible in the mid-ground to the left of the telescope.

# 2022 GREEN BANK OBSERVATORY

## MISSION STATEMENT

***Green Bank Observatory enables leading edge research at radio wavelengths by offering telescope, facility, and advanced instrumentation access to the astronomy community as well as to other basic and applied research communities.***

***With radio astronomy as its foundation, Green Bank Observatory is a world leader in advancing research, innovation, and education.***

*Image above: in a series of nine papers, scientists from the GOTHAM—Green Bank Telescope Observations of TMC-1: Hunting Aromatic Molecules—project described the detection of more than a dozen polycyclic aromatic hydrocarbons in the Taurus Molecular Cloud, or TMC-1. These complex molecules, never before detected in the interstellar medium, are allowing scientists to better understand the formation of stars, planets, and other bodies in space. In this artist's conception, some of the detected molecules include, from left to right: 1-cyanonaphthalene, 1-cyano-cyclopentadiene, HC11N, 2-cyanonaphthalene, vinylcyanoacetylene, 2-cyano-cyclopentadiene, benzonitrile, trans-(E)-cyanovinylacetylene, HC4NC, and propargylcyanide, among others.*

*Center for Astrophysics/Harvard & Smithsonian, M. Weiss.*

**Nestled in the mountains of West Virginia, astronomers search for answers to humanity's most extraordinary scientific questions.**

*Photo credit (& cover) Jay Young*

The Green Bank Observatory is the home of the 100-meter Robert C. Byrd Green Bank Telescope (GBT), the world's premier single-dish radio telescope. The Observatory campus includes an acclaimed Science Center, machine shop, electronics laboratory, and seven additional radio telescopes, along with a cafeteria and housing. The Observatory's operations, surrounded by the Allegheny Mountains in Deer Creek Valley, is protected by two complementary radio interference protection zones – the National Radio Quiet Zone and the West Virginia Radio Astronomy Zone – providing significant protection for astronomical observations.

Green Bank is an attractive location for independent research experiments, and serves as the field station for several university-based research teams.

The Observatory machine shop and electronics laboratory have built state-of-the-art components and instruments for telescopes and research facilities around the world. The nearly 2,700-acre site has significant infrastructure which allows for the installation of any instrument that may benefit from the radio quiet location. There is ample space for new projects, a radio frequency test range, and anechoic chamber.

The Observatory's educational and public outreach programs for learners of all ages, and hands-on research experiences for students and educators, are nationally acclaimed.

Green Bank is a welcoming, creative, and tight-knit community. Our award winning staff come from the surrounding area, across the country, and around the world, and are proud to call this place home.

*Image right: the Green Bank Telescope Diffuse Ionized Gas Survey (GDIGS) is a large ongoing survey to map radio recombination line emission from diffuse ionized gas in the Galactic plane. This GDIGS map shows ionized gas near the giant star-forming region W43. NSF/GBO/P.Vosteen*

## MILKY WAY'S DEFENSIVE HALO BLOCKS INCOMING GAS CLOUD

How are galaxies able to keep forming stars and planets? Astronomers from Texas Christian University used the Green Bank Telescope and simulations of gas instability processes to study high-velocity clouds that are being drawn into our Milky Way galaxy by its gravitational pull. Dr. Kat Barger led a team observing Complex A, a high velocity gas cloud containing enough material to make more than 2 million Suns – if all of it could reach our Milky Way.

## HOW LONG IS A DAY ON VENUS? SCIENTISTS CRACK MYSTERIES OF OUR CLOSEST NEIGHBOR

Venus is an enigma. It's the planet next door and yet reveals little about itself. An opaque blanket of clouds smothers a harsh landscape pelted by acid rain and baked at temperatures that can liquify lead.

New observations from the Green Bank Telescope and the Goldstone antenna are lifting the veil on some of Venus' most basic properties. By repeatedly bouncing radar off the planet's surface over the last 15 years, a UCLA-led team has pinned down the precise length of a day on Venus, the tilt of its axis and the size of its core.

## SUCCESSFUL TEST PAVES WAY FOR NEW PLANETARY RADAR

The GBT was outfitted with a new transmitter developed by Raytheon Intelligence & Space, allowing it to transmit a radar signal into space. The NRAO's continent-wide Very Long Baseline Array (VLBA) received the reflected signal and produced images of the Apollo 15 moon landing site. The proof-of-concept test, culminating a two-year effort, paves the way for designing a more powerful transmitter for the telescope. More power will allow enhanced detection and imaging of small objects passing by the Earth, moons orbiting around other planets and other debris in the Solar System.

## NANOGrav & GREEN BANK TELESCOPE POISED TO MAKE GROUNDBREAKING DISCOVERIES OF GRAVITATIONAL WAVE UNIVERSE

For the next three years, astronomers from the North American Nanohertz Observatory for Gravitational Waves (NANOGrav) will have increased access and new technologies to use on the Green Bank Telescope in their breakthrough scientific studies of gravitational waves. This new technology and additional observation time is supported by funding from the Moore Foundation.

## NEW INSTRUMENT WILL IMPROVE LOCALIZATION OF FAST RADIO BURSTS

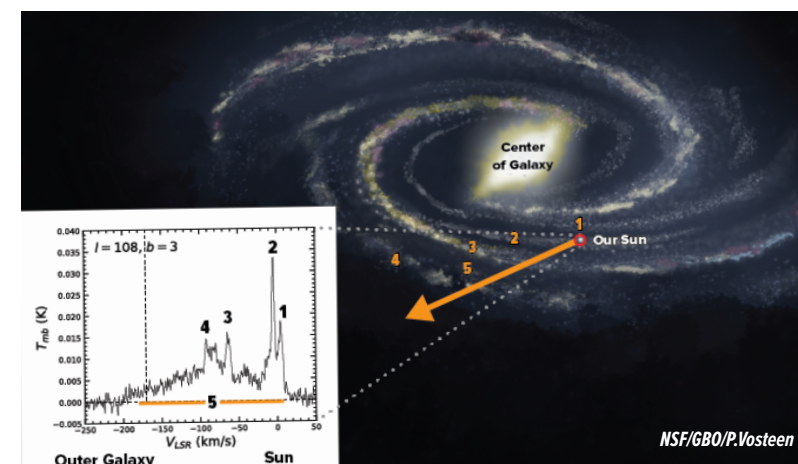

West Virginia University recently announced that a \$1.7 million National Science Foundation grant will be used to construct a new telescope at the Observatory. This new instrument will be used in association with the Canadian Hydrogen Intensity Mapping Experiment, or CHIME, telescope, which is located half a continent away in British Columbia. CHIME's focus is studying Fast Radio Bursts, or FRBs. The new instrument at Green Bank will work with the existing CHIME telescope to triangulate the locations of FRBs.

## MORE THAN MEETS THE EYE: COMPLETE IMAGING OF CLUSTER COLLISION

This composite image of a giant cosmic collision was created by an international team of astronomers using radio, X-ray, and optical data collected with the MUSTANG-2 receiver on the GBT, the European Science Agency's (ESA) XMM-Newton Satellite, and the National Astronomical Observatory of Japan's (NAOJ) Subaru Telescope in Hawaii. The dazzling colors reveal a dramatic temperature increase resulting from the collision-induced shock – a rise from 40-million°C in the overall body of the cluster, to a whopping 400-million°C.

## MASSIVE INVISIBLE GALACTIC STRUCTURE IS DISCOVERED – BY ACCIDENT

The GBT detected a massive, gaseous structure in our Milky Way, using OH as an alternative tracer of H2. The find was so unexpected, the 20-meter telescope was used to confirm it. What impact will this have on astronomy? The existence has implications for star formation theories, as well as the structure, make-up, and total mass of the interstellar medium.

# our SCIENCE

## COMPACT OBJECTS AND FUNDAMENTAL PHYSICS

The rapid, clock-like rotation of pulsars makes them unique tools for studying fundamental physics and stellar evolution. The GBT is a premier instrument worldwide for pulsar studies because of its sensitivity, wide frequency coverage, and location in the NRQZ.

Pulsar studies will usher in the next great era of Gravitational Wave (GW) astronomy by opening the nanohertz GW spectrum, which will be dominated by the most massive objects in the Universe—supermassive binary black holes. This GW breakthrough will be achieved though monitoring the pulse arrival times from dozens of millisecond pulsars with an accuracy of tens to hundreds of nanoseconds over the course of many years using the NANOGrav Pulsar Timing Array (PTA), of which the GBT is a critical component.

## STAR FORMATION AND EVOLUTION

The GBT will be used to map the starless and dense cores in the widely used dense gas tracer  $\text{N}_2\text{H}^+$  to better understand the formation and diversity of protostellar disks and binary/multiple systems. Ammonia ( $\text{NH}_3$ ) lines in the Milky Way's giant molecular filaments will be mapped to determine their role in star formation. Turbulent gas within the Milky Way will be studied to further refine its role as a regulator in star formation. GBT data will also be combined with ALMA observations to systematically measure the core mass function toward a sample of the most massive, parsec-scale clusters in the Milky Way.

## THE INTERSTELLAR MEDIUM

An understanding of the interstellar medium (ISM) is essential for many areas of astronomy. Stars and planetary systems form from dense regions of the ISM, and at the end of their lives, stars recycle this material by injecting heavy elements back into the ISM in supernova explosions. With its wide frequency coverage, excellent sensitivity, and location in the National Radio Quiet Zone (NRQZ), the GBT has contributed significantly to ISM studies and will continue to do so in the coming years.

The GBT has been used to survey TMC-1 at high resolution and sensitivity to accurately determine the astrochemical models for this and similar regions of the ISM. The GBT has also detected phosphorus-bearing species within the ISM, which may have been essential key to form life on Earth. The GBT also studies  $\text{NH}_3$  in the inner regions of the Milky Way where previous observations have shown the ISM to have elevated gas temperatures to better understand heating mechanisms and their contributions to overall feedback within the ISM.

## THE SEARCH FOR TECHNOSIGNATURES

The search for life beyond the solar system can be divided into two primary research areas; astrobiology (the search for complex, life-bearing signatures), and technosignatures (the search for signatures of a technological civilization).

Beginning in 1960 with Project Ozma's use of the Green Bank Tatel telescope to monitor Tau Ceti and Epsilon Eridani for technosignatures, and the formulation of the Drake Equation in 1961, the Observatory continues to play a significant role in the search for technosignatures. At the present, the majority of the Observatory's work in technosignatures is through Breakthrough Listen. Breakthrough Listen is using the GBT and other telescopes around the world to survey the 1,000,000 closest stars to Earth, the center of our galaxy, and the entire Galactic plane, as well as the 100 closest galaxies. The GBT will continue this important work, searching the most promising nearby star for technosignatures while also searching the universe for the important precursors of life.

## THE SOLAR SYSTEM

The GBT is a unique asset in the field of planetary science. Working with the Arecibo and Jet Propulsion Lab's (JPL) transmitters, the GBT's large collecting area, clean beam, optimized receivers, and location on the east coast of the U.S., make it the instrument of choice for bi-static radar studies of Solar System objects and telemetry observations in support of spacecraft missions. The GBT is also ideal for the study of transitory phenomenon such as comets and asteroids. Bi-static radar techniques will continue to dominate asteroid research programs for the GBT into the future. With the upgrade of the Goldstone radar system now complete, bi-static radar imaging will continue to provide high-resolution maps of the most important and interesting asteroid bodies.

## TRAINING & PROPOSAL CALLS

Training workshops are offered in the spring, summer, and fall. See our website for current workshop dates and to register <https://greenbankobservatory.org/science/gbt-observers/observer-training-workshops/>

Calls for proposals to observe using the GBT are issued twice a year [greenbankobservatory.org/science/gbt-observers/proposals](https://greenbankobservatory.org/science/gbt-observers/proposals)

## SHARING OUR SCIENCE

The Observatory hosts many public and private workshops and conferences each year, from special topics focusing on radio astronomy, to the Society of Amateur Radio Astronomers and other groups. Presentations from these events are often recorded, archived, and shared at our website.

READ MORE [greenbankobservatory.org/science/science-2020-2030](https://greenbankobservatory.org/science/science-2020-2030)

## GALAXY CLUSTERS

The collapse of galaxy clusters is driven by the strongest fluctuations in the primordial matter power spectrum. As direct tracers of fluctuations in the early Universe, clusters are important signposts of the large-scale spatial distribution of dark matter, and therefore provide one of the most sensitive probes of the unknown equation of state of dark energy.

The Sunyaev-Zeldovich Effect (SZE) provides a tool for studying the hot gas in clusters that is uniquely redshift-independent due to its nature as a fractional scattering of the cosmic microwave background. With its large size and the sensitivity of a single dish to low surface-brightness emission, the GBT is uniquely positioned to study galaxy clusters through measurement of the SZE. The large format MUSTANG-2 bolometer camera on the GBT measure the SZE at 3mm with uniquely high sensitivity at an angular resolution of 10", testing predictions for the SZE signal in detail.

The GBT has observed as part of the MaDCoWS project, a comprehensive program to detect and characterize the most massive galaxy clusters in the universe at  $z \sim 1$  and above. The goal of the program is to understand cluster mass scaling relations, identify high mass clusters that can be used for cosmological and strong lensing studies, and study the evolution of massive galaxies in over-dense environments.

## GALAXY FORMATION AND EVOLUTION

The GBT's sensitivity to diffuse gas makes it an ideal instrument for the study of evolution of galaxies from the local ( $z=0$ ) through the distant ( $z>6$ ) Universe. Mapping the distribution and flow of cold gas within clusters and proto-clusters of galaxies, studying global star formation in nearby galaxies, determining the dynamics of the Galactic Bar, and mapping the HI clouds and bubbles within the Milky Way are just a few of the many ways the GBT will be contributing to our understanding of this important field.

The GBT will play a vital role in our general understanding of the evolution of galaxies through observations of redshifted CO(1-0) emission. Using the GBT, the redshifts and molecular gas masses have been measured for sets of ultra-luminous infrared lensed galaxies at high redshift that were discovered in wide-area Herschel and Planck surveys. GBT observations will continue to provide the impetus for follow-up high-resolution imaging studies of individual sources with ALMA and the VLA.

# ROBERT C. BYRD GREEN BANK TELESCOPE

The GBT's fully steerable 100-meter unblocked aperture, active surface, 0.29-116 GHz frequency coverage, flexible instrumentation, and location in two different interference protection zones makes it one of the world's premier telescopes for studying low-frequency gravitational waves, multi-messenger astronomy, fundamental physics, fast radio transients, cosmology, star formation, astrochemistry, gas in galaxies, and the search for technosignatures.

6,500 HOURS  
OBSERVING  
ANNUALLY

0.29-116 GHz  
FREQUENCY  
COVERAGE

REACHING  
85% OF THE  
CELESTIAL  
SPHERE

The GBT has achieved excellent 3mm capabilities, with 35% and 18% aperture efficiency at 90 and 115 GHz, respectively. The GBT utilizes a dynamic scheduling system that optimizes each observing project's scientific goals against the predicted weather conditions. In FY2020, the last full year of operation, the GBT offered 7,172 hours of observing and test time, equivalent to an operational efficiency of 82%. This availability will continue through FY2022.

The GBT covers a frequency range of 290 MHz to 116 GHz (non-contiguous), with an instrument suite consisting of single/dual-pixel receivers from 290 MHz to 93 GHz and a seven-pixel heterodyne focal plane array at 18–26 GHz. The GBT features industry-leading signal processing systems with

a high dynamic range, a state-of-the-art system for high time and frequency resolution observations, and the capability for very wide bandwidth observations for spectral line and pulsar detection experiments. Two additional cameras, ARGUS, a 16-pixel single polarization array from 90–116 GHz and MUSTANG2, a 200+ pixel bolometer array at 81–100 GHz, are operated as instruments that may require added support from their principal investigators. Spectral and continuum observation data are processed with the VERSatile GBT Astronomical Spectrometer (VEGAS). Other instruments in use include a Digital Continuum Receiver (DCR), a Mark 6 VLBA disk recorder, and a Caltech Continuum Backend (CCB) managed by the Jet Propulsion Laboratory (JPL).

## TECHNOLOGY current & future

The GBT was built to be flexible and to be upgraded regularly to anticipate the needs of the astronomical community. In the next decade, several projects will expand the GBT's performance.

The Observatory operates state-of-the-art electronics and digital development labs specializing in the design of low-noise cryogenic receivers and FPGA-based wideband digital backend systems. The Machine Shop builds nearly all GBT feed horns, dewars, RFI enclosures, and other custom components.

**ULTRAWIDEBAND SYSTEMS** The Observatory is developing a 0.7-4 GHz Ultra Wide Band receiver to improve its sensitivity for pulsar studies of low frequency gravitational waves and fast radio transients. It will also be used for molecular spectroscopy and measurement of radio recombination lines.

**IMPROVED PERFORMANCE** The GBT is currently testing a new laser scanning system (LASSI) which, when complete, will increase the GBT's availability for mm-wavelength observation by 50% or more. LASSI uses a laser scanning system and the GBT's surface actuators to rapidly sample the full 2.3 acre dish and the correct for any deviations from idea in near real time, providing a surface that has an overall surface r.m.s. of accuracy better than 270 microns.

**SHARING THE RADIO SPECTRUM** Spectrum occupancy will continue to grow for the foreseeable future. The Observatory has been actively testing several techniques for automated radio frequency interference detection and excision. The next generation of wideband digital backends will be built incorporating these new technologies.

**NEXT GENERATION VERY LARGE ARRAY (ngVLA)** will include several antennae at the Green Bank Observatory. This large project is under consideration in the Astro2020 Decadal Review and will have 10x the sensitivity of the current Jansky VLA and a proposed frequency range (1.2 - 116 GHz) that complements the range of frequencies available to the GBT. The array design features a dense core of 18-meter antennae for low surface brightness imaging and extended baselines up to nearly 10,000 km for exquisite angular resolution. Site benefits include the radio quiet environment of Green Bank, geographic position compared to other planned antenna stations, and our readily available fiber, power, and infrastructure.

# TELESCOPES

Green Bank's instruments have been used for a wide range of purposes including satellite tracking, spacecraft tracking, atmospheric studies, monitoring of astronomical and planetary phenomena, and educational programs.

**NATIONAL  
RADIO QUIET ZONE**  
13,000 square miles  
of regulatory protection  
on all fixed, licensed  
radio transmitters

**WEST VIRGINIA  
RADIO ASTRONOMY  
ZONE**  
10 mile radius,  
increased restrictions  
on all electrical emissions

**85-FOOT TELESCOPES** In 1959, the first 26-meter telescope, known as the **Tatel Telescope**, was built on site. Soon after, two more were added, the 85-2 and 85-3. While able to be run independently, the three telescopes were most often used together as the Green Bank Interferometer. Use of the telescopes ended in 2000, and they are now preserved for their historical significance. With refurbishment, all three can be restored to full operations.

**20-METER TELESCOPE** Built for the United States Naval Observatory in the 1990s, it participated in a global program of Earth Orientation very long baseline interferometry measurements in cooperation with the International Earth Rotation Service and the NASA Space Geodesy program. In recent years it has been used to search for Fast Radio Bursts, monitor the Crab Pulsar, and map the OH within the Milky Way. It is used as an educational telescope as part of the University of North Carolina's Skynet program.

**45-FOOT TELESCOPE** This 13.7-meter diameter telescope was built in 1973 as the outlying fourth element of the Green Bank Interferometer and was critical to prove that the long baselines of the Very Large Array would be feasible. It was later converted by NASA into a tracking station for orbiting satellites. The antenna, combined with Japan's orbiting HALCA satellite, became part of what was once the largest telescope every used — an interferometer that spanned 60,000 miles. Later, it was re-purposed for daily solar observations as part of the Frequency Agile Solar Radio telescope, through 2012.

**140-FOOT TELESCOPE** Built for radio astronomy research in the 1960s, the 43-meter diameter telescope has an equatorial mount which allows it to avoid any tracking, or "zone of avoidance," issues when tracking objects at or near the zenith. It worked as an astronomical research instrument from 1965 through 1999 when it was retired as a general user facility. Six years later, in 2005, the 43m telescope was put back into use, this time as part of a satellite tracking program instituted by the Massachusetts Institute of Technology's Lincoln Laboratory to study the ionosphere. From 2012-2019, it served as a satellite data down-link station for a space-based astronomy satellite, Spektr-R's RadioAstron instrument.

**40-FOOT EDUCATION TELESCOPE** Purchased from a commercial vendor in 1961, this inexpensive aluminum instrument took only two days to set up. With a control system designed and built by Observatory staff, it became the world's first fully automated telescope, providing unmanned observing focused solely on radio sources. In 1987 it was recommisioned as an educational telescope and is now used to teach radio astronomy to thousands of students and adults each year.

GREEN BANK OBSERVATORY TELESCOPES AVAILABLE FOR NEW PROJECTS						
DIAMETER	PERFORMANCE	TRACKING	POINTING	SKY COVERAGE		STATUS
	(Efficiency)	SPEED	ACCURACY	ELEVATION	AZIMUTH	
		(°/min)	(°)	(°)	(°)

# the future of **ENGINEERING**

MECHANICAL • ELECTRICAL • COMPUTER • HARDWARE • SOFTWARE

**Observatory staff possess decades of combined expertise and experience developing, building, and repairing all of the instruments and systems in Green Bank, and have built or contributed to many more projects worldwide.**

**While focused towards Green Bank operations, the staff are also able to develop innovative solutions and products for other research organizations around the world.**

## **DIGITAL**

Focusing on issues ranging from active surface electronics through optimized analog-to-digital conversion, active signal excision and FPGA and GPU technologies, the Green Bank Observatory's digital engineering group provides state of the art research and technologies into all aspects of telescope operations and signal processing. Current projects underway in the digital group include real-time RFI excision across 5-10 GHz bandwidths, modernized active surface control and metrology techniques, and high bit, high time resolution signal processing.

## **MICROWAVE**

The Observatory's microwave engineering group maintains a laboratory equipped with state-of-the-art test and measurement equipment, including a bonding machine and probe station for building and testing Monolithic Microwave Integrated Circuit (MMIC) devices, an Anritsu Vector Star vector network analyzer capable of measuring microwave components up to 115 GHz, and an assortment of RF and fiber optic devices. The RF laboratory routinely produces working RF board and receiver designs up to 115 GHz using CST Microwave and Microwave Office development software. Recent projects include a 19-element L-band cryogenic Phased Array Feed receiver, a K-band focal plane array, and a dual beam 4mm receiver with calibration optics. The staff also routinely experiments with commercially available MMIC devices to improve gain stability and baseline performance of the current GBT systems. The Ultra Wide Band Receiver, X-Band Receiver, and radar projects have all been supported in-house.

## **SOFTWARE**

The Observatory's software development division develops, maintains, and upgrades subsystems supporting the optimization, operation, and data reduction for all Observatory telescopes and systems, including: observation management, telescope monitor and control, telescope scheduling, data reduction, and data archiving, visitor reservations and site management and administration. The division simultaneously supports new development and ongoing operations using development methodologies that best support a given project and team. This makes effective use of automation, and carefully balances custom code development with open source solution integration.

## **MECHANICAL**

The Observatory shop completes countless challenging fabrications each year, often developed from sketches provided by engineers and scientists. Rapid repair capabilities maximize telescope efficiency and compress development schedules for producing instruments. Machinists produce parts with tolerances that are much tighter than most commercial shops. The shop utilizes a full range of fabrication techniques that include both manual and CNC machines for fabrications from the very small through the very large, along with 3-D printing and welding across a wide variety of metals and techniques.

DESIGN • FABRICATION • REPAIR • MAINTENANCE • COMMERCIAL

## FACILITIES

### RESEARCH & FIELD STATIONS

The Observatory is an attractive location for independent research experiments, and serves as the field station for several university-based research teams.

The site has significant infrastructure which allows for the installation of any instrument which may benefit from the radio quiet location, as well as a **radio frequency test range** for receivers and for testing antenna beam patterns, and a large **anechoic chamber** for testing radio emissions from all types of equipment.

With nearly **2,700 acres** of land, good network connectivity, and reliable power, numerous groups have also taken advantage of the infrastructure and radio quiet zones to deploy their own instruments on site. These include several arrays of telescopes and antennas operating from 20-100 and 100-200 MHz, one station from a nation-wide magnetometer array, a GPS sensor deployed as part of West Virginia's geo-spatial array, along with a CHIME prototype array and outrigger antenna.

**2,700  
ACRES**

**ANTENNAS,  
TELESCOPE  
ARRAYS &  
OUTRIGGERS**

**ANECHOIC  
CHAMBER**

**RADIO  
FREQUENCY  
TEST RANGES**

## CONFERENCES

The Observatory hosts numerous public and private **meetings, workshops, and events** year round at **auditoriums** in the Jansky Lab and Science Center, with full presentation capabilities.

Several **classrooms** and a **computer lab** are available in the Science Center. While WIFI is not available onsite to avoid interference with our observations, wired internet connections are available in numerous locations.

## ACCOMMODATIONS

Several options for **overnight stays** are available at the Observatory, including apartments, houses, and a dormitory which is ideal for student and Scout groups. Other accommodations can be found in the surrounding area for larger groups.

The Observatory **cafeteria** can serve breakfast, lunch, and dinner. **Catering** is available across campus, including coffee breaks, receptions, and meals. Refreshments and meal options are also available directly from the Science Center **Starlight Cafe**, whose hours vary by season.

The Drake Lounge, located above the cafeteria, is a historic space that is often used for receptions and informal gatherings.

There is ample **parking** at several locations on site, with room for RVs, buses, and motorcoaches.

**Charging stations** for electric vehicles are located next to the dormitory.

## GALAXY GIFT SHOP

On site and online, we offer a wide range of gifts for science lovers of all ages, including unique products made in our Observation machine shop. Members, conference attendees, and educators receive a discount. [shop.greenbankobservatory.org](http://shop.greenbankobservatory.org)

## RECREATION

The Observatory features a 1.5-mile (3-mile out and back) paved **self-guided walking tour** of the Solar System, ending at the GBT.

**Bicycles** are welcome on the grounds to explore **10-miles of trails** on paved, mowed, gravel, and single-track surfaces. Trail maps are available online (download and print before you visit) in the Science Center and Jansky Lab, and posted at **trail head parking** located at the rear of the Jansky Lab parking lot. **Primitive camping** is available in specific locations, and is a part of several special events each year.

# EDUCATION

## STUDENTS

The Observatory's staff and facilities offer extraordinary STEM education through online and real world hands-on experiences for learners of all ages.

**RADIO ASTRONOMER FOR A DAY** Scientists routinely tackle questions that don't yet have answers. This student overnight program provides an authentic research experience with tours, hands-on activities, and training on a working radio telescope. This program is open to all school and youth groups (5th grade and above) and meets NGSS Nature of Science standards.

**WEST VIRGINIA GOVERNOR'S STEM INSTITUTE** Funded by the State of West Virginia, the Observatory hosts sixty 8th graders for a 2-week summer camp focusing on science, astronomy, and personal development.

**PHYSICS INSPIRING THE NEXT GENERATION** PING engages traditionally underrepresented students to science and engineering, with a focus on physics and radio astronomy. Launched in 2014, PING immerses middle school students in a 2-week residential research camp and undergraduate students in a 10-week internship that includes mentoring the younger students.

**FIRST2NETWORK** With funding from the NSF, the Observatory coordinates a national program to connect underserved first generation college students from diverse groups to STEM career mentorships, training opportunities, and employment.

### PULSAR SEARCH COLLABORATORY

The PSC engages high school students and their teachers in the quest to discover new pulsars and transient sources by analyzing data from the GBT. Twice each academic year the Observatory holds a six-week online training course. Participants may apply to summer camp at the Observatory and annual capstone events. Several PSC students have discovered new pulsars and become published authors before graduating from high school!

**WEST VIRGINIA SCIENCE PUBLIC OUTREACH** WVSPOT began in 2013 as a NASA partnership, that trains undergraduates to deliver interactive science, technology, and engineering presentations to K-12 classrooms, museums, and youth programs. To date, over 800 presentations have been given, impacting the lives of over 25,000 students.

**SKYNET JUNIOR SCHOLARS** SJS allows educators and students to gain access to telescopes around the world, including the 20m radio telescope at the Observatory. Students remotely access telescopes to collect real project data and collaborate with each other in online communities. Educators and youth leaders can form their own clubs.

**WEST VIRGINIA LEAP INTO SCIENCE** The Observatory provides professional development to this network of informal educators which brings engaging STEM-inspired early childhood and family science events to community settings. Educator training opportunities and other resources are available.

### GBO & NRAO RESEARCH EDUCATION EXPERIENCE

Each summer nearly sixty students are paired with staff for immersive virtual and site based research and training experiences.

## VIRTUAL PROGRAMS

Can't come to the Observatory? Tune in from home, and we will come to you! **Virtual Site Tours** are offered for individuals and groups of all ages throughout the year.

Approved groups of five or more students can register for a **Virtual Field Trip** to learn about the Observatory history, radio astronomy, our latest science, and more! These programs are tailored to your curriculum and time available. Learn more and sign up today:

[greenbankobservatory.org/education/virtual-visits](https://greenbankobservatory.org/education/virtual-visits)

## CAREER DEVELOPMENT

From high school through post-doctoral studies, students have several opportunities to explore career options in STEM and other work fundamental to the operations of the Observatory.

**POST-DOCTORAL POSITIONS** Post-Docs are an integral part of the Observatory team and balance a variety of duties along with their own independent research. Two to three year positions are available on a rolling basis.

**SUMMER EXPERIENCE FOR UNDERGRADUATES** Summer positions can include astronomical research, and software, electrical, or hardware engineering, as well as working with plant maintenance and the machine shop. Students involved in basic research often attend scientific conferences and publish their results.

**INTERNSHIPS** These paid appointments provide staff support in a specific division, along with on-the-job training, tailored to meet specific academic requirements.

**APPRENTICESHIPS** Learn how to do a specialized job through on-the-job training, under the guidance of an experienced colleague. Three to six months paid appointments are available in mechanical engineering, machining, electronics and telescope maintenance/mechanics.

**CO-OPS** Academic institutions are encouraged to contact the Observatory directly with proposals for student placements.

## EMPLOYMENT

The Observatory is hiring permanent, temporary, and seasonal positions. Current openings can be found at [greenbankobservatory.org/careers](https://greenbankobservatory.org/careers)

A diverse staff is critical to mission success: enabling world-class science, training the next generation, and fostering a scientifically engaged society. Green Bank Observatory is committed to a diverse and inclusive work place culture that accepts and appreciates all individuals.

## EDUCATORS

### RESEARCH EXPERIENCE FOR TEACHERS

In conjunction with West Virginia University, this 6-week summer research program trains teachers in digital signal processing in radio astronomy. Learn how to use an inexpensive, versatile and rapidly developing technology (software defined radios) which can be implemented for astronomy applications as well as for receiving signals from satellites, like the NOAA weather satellites. Each summer, up to eight teachers spend 4-weeks at WVU, and 2-weeks at the Green Bank Observatory.

### CHAUTAUQUA SHORT COURSES

This 2.5-day course shares the fundamentals of radio astronomy and cutting edge scientific research with small college and community college faculty from around the nation. Each year between 25-30 participants interact with Observatory astronomers and engineers, enjoy behind the scenes tours and use educational radio telescopes to complete projects.

# SCIENCE CENTER

The 25,000 square-foot Science Center features a 150-seat auditorium, classrooms, indoor star lab, computer lab, Galaxy Gift Shop, and Starlight Café. There is no admission fee to visit the *Catching the Wave* Exhibit Hall or take a self-guided walking tour of the Observatory.

Fees are charged for guided public tours and some special events. Advanced registration is required for field trips and large groups. There is ample parking for buses and RVs. The Science Center is accessible and wheelchairs can be accommodated on buses for guided public tours.

**Dates of operation and hours change seasonally. The Center may close or cancel events to support necessary safety regulations during times of need. Virtual tours and activities are available and self-guided walking tours are always welcome.**

Visit [greenbankobservatory.org](https://greenbankobservatory.org) for the latest information.

## GUIDED PUBLIC TOURS

These 1-hour tours offer a fun peek into the world of radio astronomy with science demonstrations and a bus excursion into the restricted zone surrounding the telescopes. Tickets may be purchased in the Galaxy Gift Shop, no advanced registration required.

## SPECIAL GUIDED TOURS

Focusing on unique aspects of our site's history with limited tickets available. Reservations are highly recommended, as these sell out! Dates and times are available online and in our brochure.

**High-Tech Tours** See how technology used in radio astronomy is developed, going behind-the-scenes in labs and telescope control room.

**SETI Tours** The search for extraterrestrial life began in Green Bank! Learn this history, visiting several unique locations including historic control rooms. *Some historic locations require the climbing of stairs.*

**History Tours** How did the Observatory get started? What are some of the most exciting and important achievements? Learn this history, visiting several locations. *Some historic locations require the climbing of stairs.*

**Guided Nature Walks** There is more to the site than our astronomy. Enjoy a guided walk along our nature trail and discover the valley's ecology and geology.

## FIELD TRIPS

Tours, activities, and day and overnight field trips for organized groups of students grades K-12 are available. Overnight field trips experience hands-on scientific research projects with a working radio telescope. Field trips can be customized to complement classroom curricula and other field trips in the area.

## SCOUTS

Scheduled overnight programs are offered on selected weekends. Using a working radio telescope, Scouts BSA can earn their Astronomy or Electronics Merit Badge, and Girl Scouts can earn a space-themed badge as well. Day activities are offered for Daisies and Brownies. Outside of these scheduled programs, Scout Troops may make reservations for tours and other hands-on science activities, with camping and other housing options available.

## SPECIAL EVENTS

**STAR PARTIES** Explore some of the best dark skies in West Virginia with an optical telescope. Offered monthly at sunset, all ages welcome.

**STAR LAB SUNDAYS** Family fun for all ages! Crawl into the planetarium balloon for a fascinating night sky tour. Reservations recommended.

**FAMILY SCIENCE LABS** Select Saturdays, kids ages 4-9 enjoy hands-on science projects. Reservations recommended.

**FAMILY SCIENCE DAY OPEN HOUSE** This annual afternoon of fun offers FREE guided Site Tours along with hands-on science experiments, crafts, and games for all ages.

**SPACE RACE RUMPUS\*** An annual weekend-long festival for mountain biking and road cyclists of all ages, from beginner to advanced. Clinics and rides on trails and roads, bike rodeo, star parties, bonfire, live music, and camping. Lots of fun for adventurous families!

Date and registration at [spaceracerumpus.org](https://spaceracerumpus.org)

**STARQUEST\*** The largest annual optical and radio telescope star party in the nation, camp out for 4 days and 3 nights, with a full schedule of speakers, workshops, raffles, activities, and more. Date and registration at [greenbankstarquest.org](https://greenbankstarquest.org)

*\*These events are coordinated by community partners*

## explore more

A visit can complement many other adventures in the region! The Observatory is surrounded by the Monongahela National Forest. There are many scenic natural areas, historic sites, and attractions for exciting day and overnight trips.

**15 MINUTES** Cass Scenic Railroad State Park, Greenbrier River Trail

**40 MINUTES** Snowshoe Resort, Durbin Rocket, National Youth Science Camp, Seneca Lake State Park

**WITHIN 2 HOURS** Seneca Rocks, Spruce Knob, Seneca Caverns, Smoke Hole Caverns, Blackwater Falls State Park, Davis, Cranberry Glades Botanical Area, Elkins, Marlinton, Lewisburg, Droop Mountain Battlefield, the Greenbrier, Monterey, Warm Springs, the Homestead Resort, Garth Newel Music Center
